

Biophysical models of synaptic plasticity

Oct 30th, 2015

Michael Graupner

michael.graupner@parisdescartes.fr

<http://www.biomedicale.univ-paris5.fr/~mgraupe/>

Why are we interested in synaptic plasticity ?

[Morris *et al.*, 1986]

Relation between LTP and learning/memory

- NMDA receptor required to learn platform location [Morris *et al.*, 1986]
- NMDA receptor required to form spatial memories (place fields)

[McHugh *et al.* 1996]

Outline

1. Synaptic plasticity : introduction

1.1 Synaptic transmission

1.2 Synaptic plasticity : induction / maintenance / states

2. Biological machinery of synaptic plasticity

2.1 NMDA receptor activation required

2.2 Postsynaptic calcium required

3. Biophysical models of synaptic plasticity

3.1 Calcium-control hypothesis

3.2 Models of processes reading out the calcium signal

Outline

1. Synaptic plasticity : introduction

1.1 Synaptic transmission

1.2 Synaptic plasticity : induction / maintenance / states

2. Biological machinery of synaptic plasticity

2.1 NMDA receptor activation required

2.2 Postsynaptic calcium required

3. Biophysical models of synaptic plasticity

3.1 Calcium-control hypothesis

3.2 Models of processes reading out the calcium signal

Different forms of plasticity

structure of neurons

changes related to neural activity

Chemical synapse : transmits electrical signals

- directional transmission
- conversion of signals allows for flexibility/plasticity

Chemical synapse : underlying biological machinery

Chemical synapse : excitatory or inhibitory

Excitatory synapse

depolarization:
excitatory postsynaptic potential (EPSP)

neurotransmitter	receptor
glutamate	AMPA, NMDA
acetylcholine	nAChR, mAChR
catecholamines	G-protein-coupled receptors
serotonin	5-HT ₃ , ...
histamine	G-protein-coupled receptors

Inhibitory synapse

hyperpolarization:
Inhibitory postsynaptic potential (IPSP)

neurotransmitter	receptor
GABA	GABA _A , GABA _B
glycine	GlyR

Short-term synaptic plasticity

train of presynaptic action potentials

- transient change in transmission efficacy
- time scale of changes ~1 sec

Long-term synaptic plasticity

- long-lasting change (>60 min) in transmission efficacy
- time scale of induction ~ 1 min

Synaptic plasticity: induction, maintenance & states

Plasticity induction: spike-frequency stimulation

hippocampus (slices)

pre  900 pulses at 1-50 Hz
post 

Plasticity induction : spike-pair stimulation

hippocampal cultures

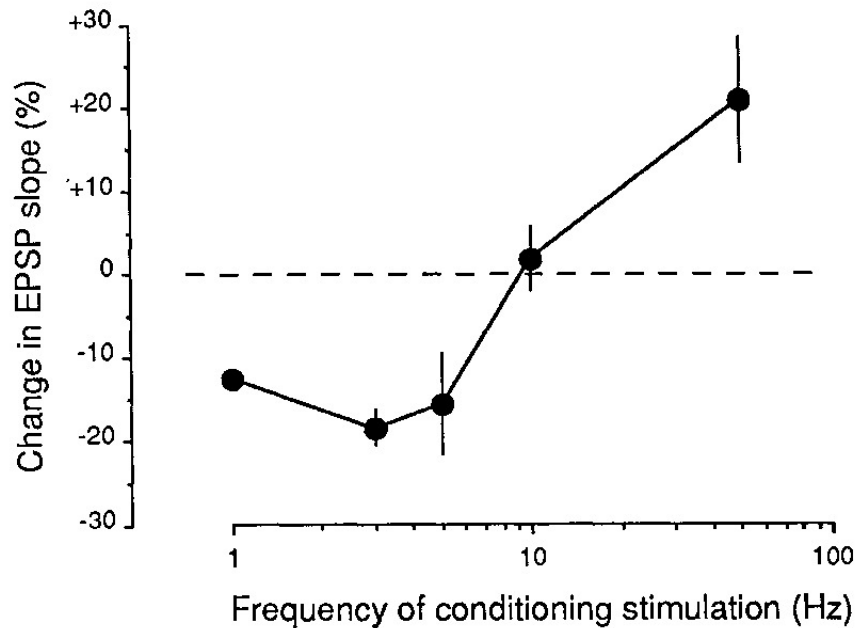

[Bi & Poo, J Neurosci 1998]

[Magee & Johnston 1997; Zhang et al. 1998; Markram et al. 1997; Sjöström et al. 2001; Feldman 200]

Induction: Stimulation protocols evoking LTP/LTD

spike-frequency

[Dudek *et al.*, 1992]

spike-timing

[Bi & Poo, 1998]

Expression of long-term changes

presynaptic

postsynaptic

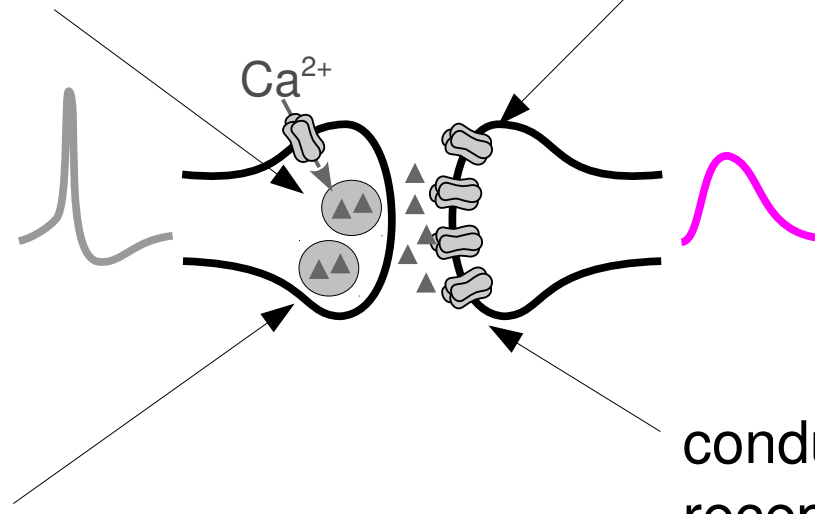

neurotransmitter vesicle
number

number of AMPA receptors

Ca²⁺

probability of vesicle
release

conductance of AMPA
receptors

States of a synapse : analog or digital?

- most experiments involved multiple synaptic contacts
 - Petersen *et al.* 1998, O'Connor *et al.* 2005 investigate single synapse
- suggest binary synapse

[O'Connor *et al.*, 2005]

Outline

1. Synaptic plasticity : introduction

1.1 Synaptic transmission

1.2 Synaptic plasticity : induction / maintenance / states

2. Biological machinery of synaptic plasticity

2.1 NMDA receptor activation required

2.2 Postsynaptic calcium required

3. Biophysical models of synaptic plasticity

3.1 Calcium-control hypothesis

3.2 Models of processes reading out the calcium signal

Plasticity requires NMDA receptor activation

hippocampal slices

[Gustafsson et al. *J Neurosci* 1987]

hippocampal cultures

[Bi & Poo *J Neurosci* 1998]

NMDAR antagonist blocks LTP/LTD induction

- CA3-CA1 pyramidal cell synapse
- CA3-CA3 pyramidal cell synapse
- Layer V – layer V synapse
- Layer II/III
- Layer IV stellate cell synapse
- Dorsal cochlear neurons (brainstem)
- Retino-tectal synapse

Induction: postsynaptic NMDA receptor activation required

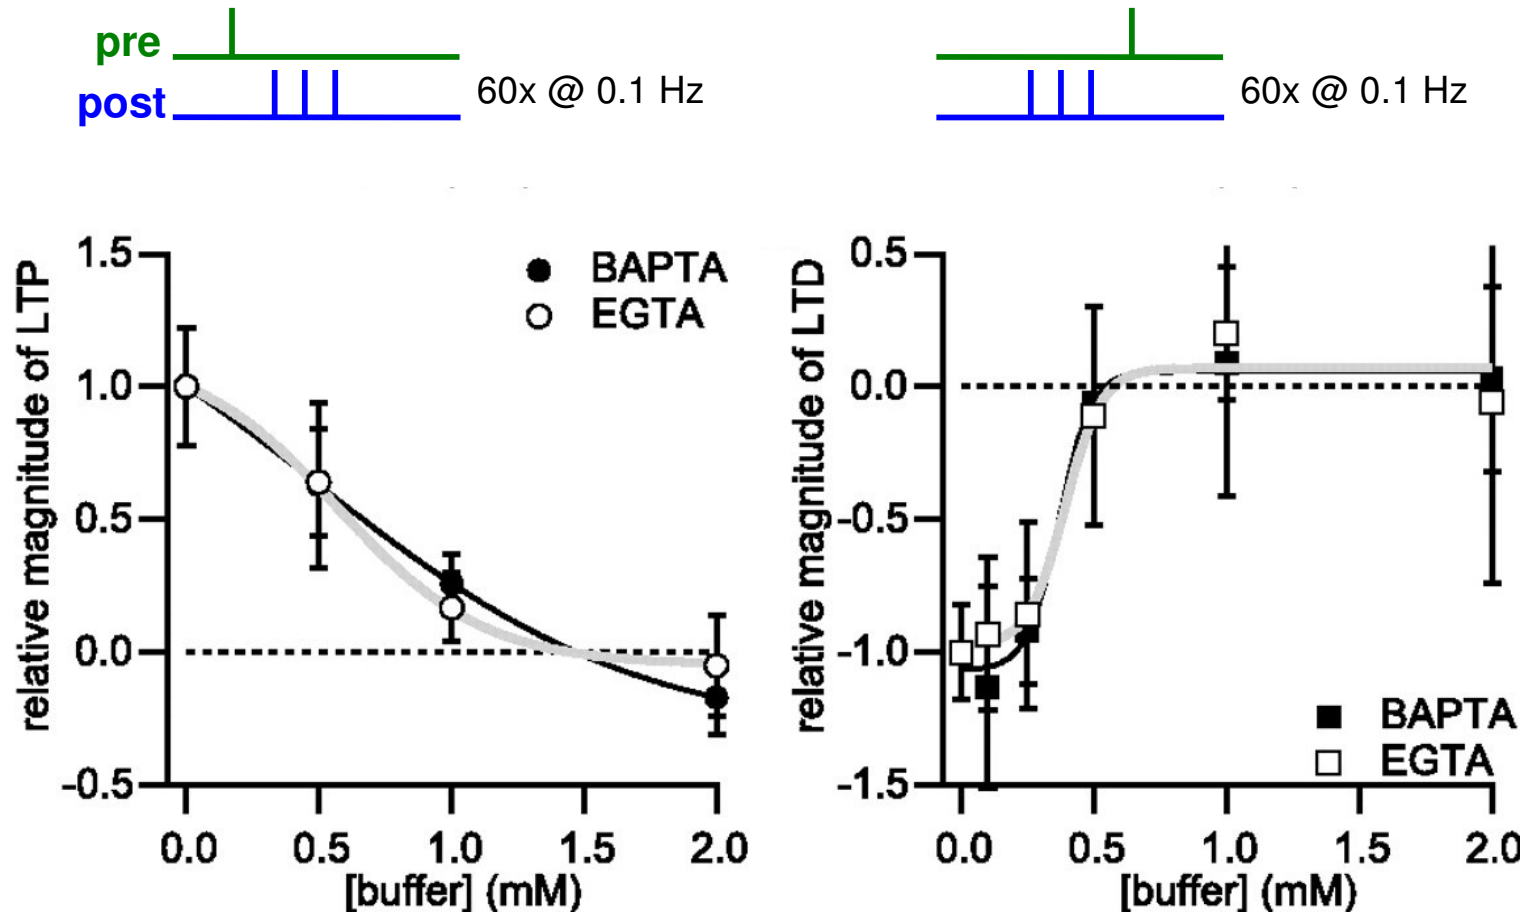

current-voltage relationship

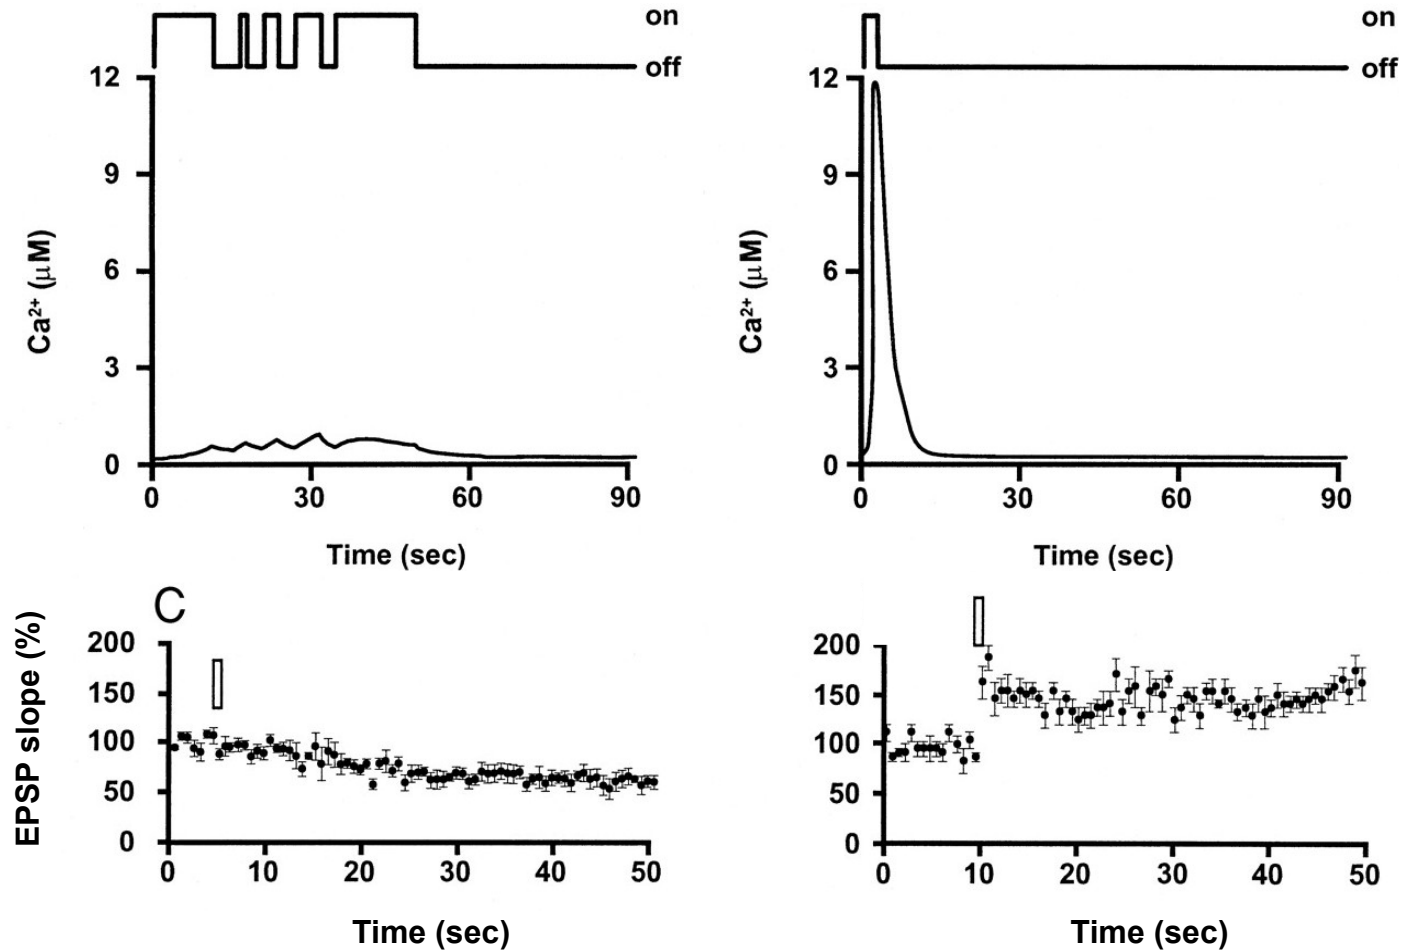

- coincidence detector :
 - presynaptic action potential → glutamate (Glu)
 - postsynaptic depolarization → Mg²⁺ block is expelled
- calcium permeable

Postsynaptic calcium *required* for plasticity

[Nevian & Sakmann *et al.*, 2006]

Postsynaptic calcium *sufficient* for plasticity

[Yang *et al.*, 1999]

- LTP induced by brief, large amplitude [Ca²⁺] increases
- prolonged, modest rise in [Ca²⁺] elicits LTD

Outline

1. Synaptic plasticity : introduction

1.1 Synaptic transmission

1.2 Synaptic plasticity : induction / maintenance / states

2. Biological machinery of synaptic plasticity

2.1 NMDA receptor activation required

2.2 Postsynaptic calcium required

3. Biophysical models of synaptic plasticity

3.1 Calcium-control hypothesis

3.2 Models of processes reading out the calcium signal

Plasticity models link activity to synaptic change

Modeling approaches : phenomenological vs. biophysical

- use pre- and postsynaptic spike times or rate to calculate change in synaptic strength
- conversion can involve arbitrarily complex mathematical models

- resolve *parts* of the underlying biological machinery involved in the induction of plasticity
- degree of biological detail varies largely

Modeling studies : phenomenological vs. biophysical

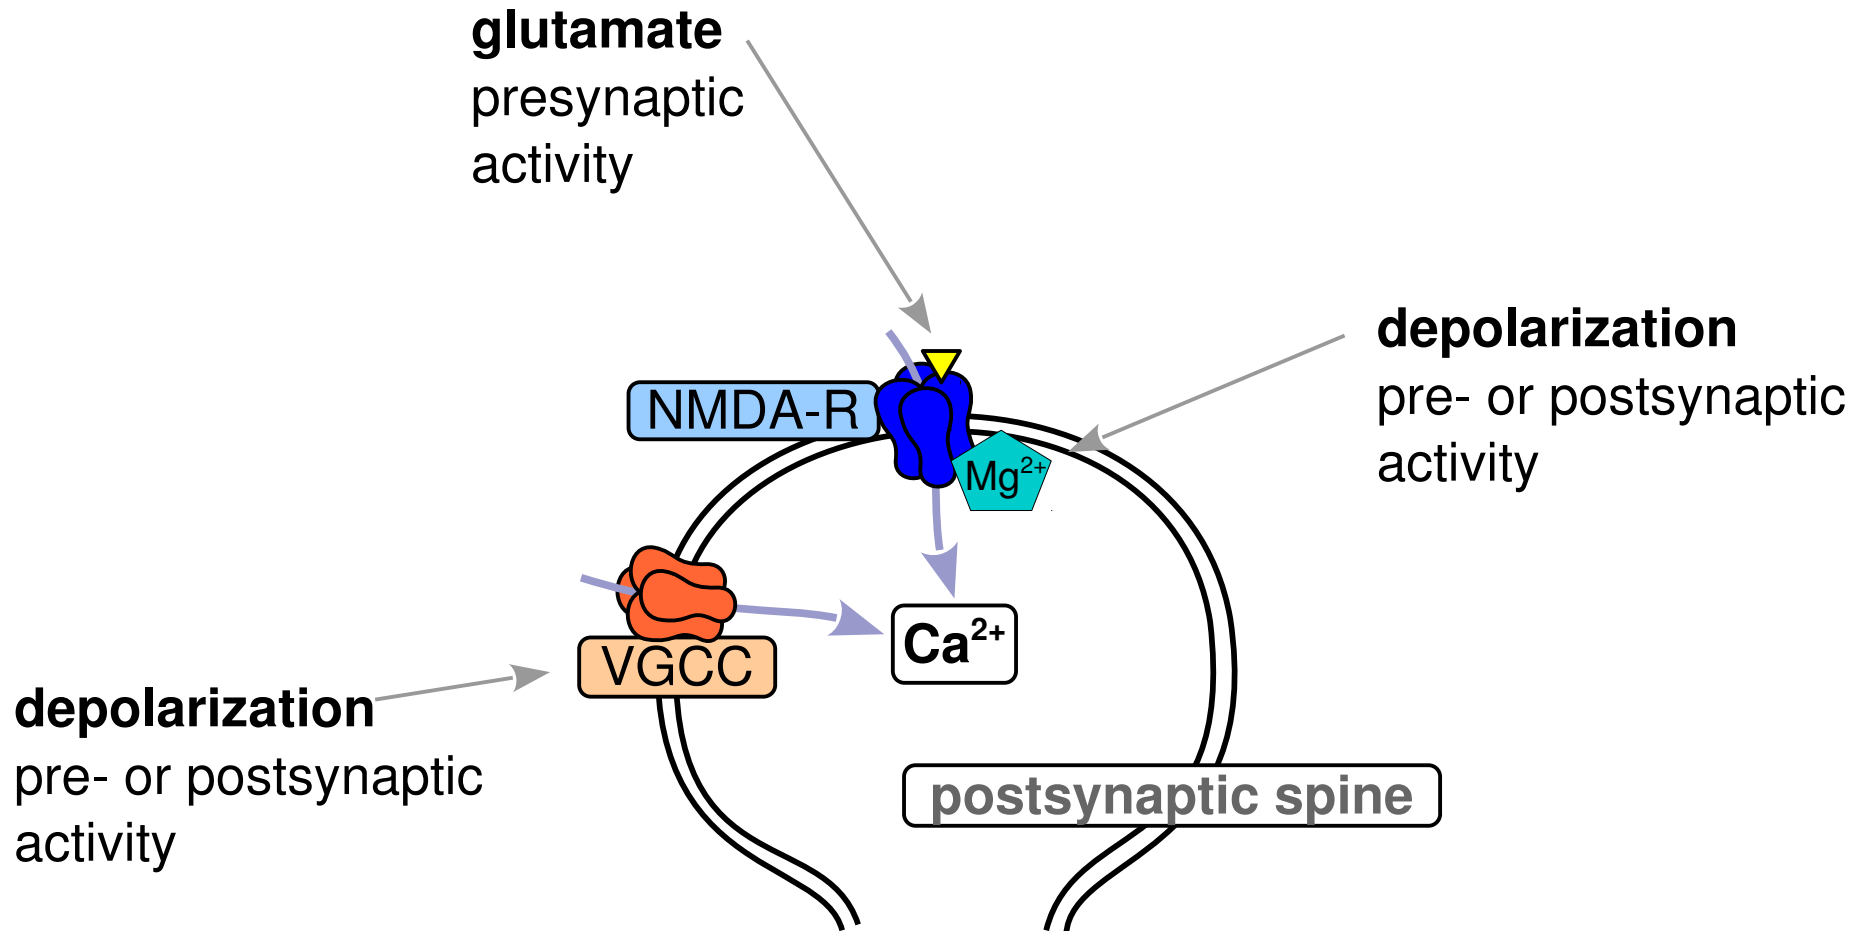

phenomenological models of LTP/LTD

- rate-based plasticity models
[Hebb, 1949; Bienenstock *et al.*, 1982; Oja, 1982]
- spike-timing based models
[Gerstner *et al.*, 1996; van Rossum *et al.* 2000; Song, 2000; Pfister & Gerstner, 2006]

biophysical models of LTP/LTD

- Voltage-based models
[Clopath *et al.* 2010]
- Ca^{2+} – dynamics based models
[Karmarkar *et al.*, 2002; Shouval *et al.*, 2002; Rubin *et al.*, 2005; Graupner *et al.* 2012]
- CaMKII kinase-phosphatase system
[Crick 1984; Lisman, 1985; Okamoto & Ichikawa, 2000; Zhabotinsky, 2000; Graupner & Brunel, 2007; Urakubo *et al.*, 2008]
- extensive protein networks
[Bhalla & Iyengar, 1999; Hayer & Bhalla, 2005]
- local clustering of receptors
[Shouval, 2005]

Calcium influx

Calcium transients from spike-pair stimulation

Calcium control hypothesis

[Shouval *et al.*, 2002]

Calcium transients from spike-pair stimulation

STDP curve

Peak Ca^{2+} amplitude does not predict LTP or LTD

More complex read-out mechanisms of Ca^{2+} signal

- two distinct but converging dynamical variables [Karmarkar *et al.*, 2002; Badoual *et al.*, 2006]

More complex read-out mechanisms of $[Ca^{2+}]$ signal

- two distinct but converging dynamical variables [Karmarkar *et al.*, 2002; Badoual *et al.*, 2006]

- phenomenological read-out of $[Ca^{2+}]$ [Rubin *et al.*, 2005]

More complex read-out mechanisms of $[Ca^{2+}]$ signal

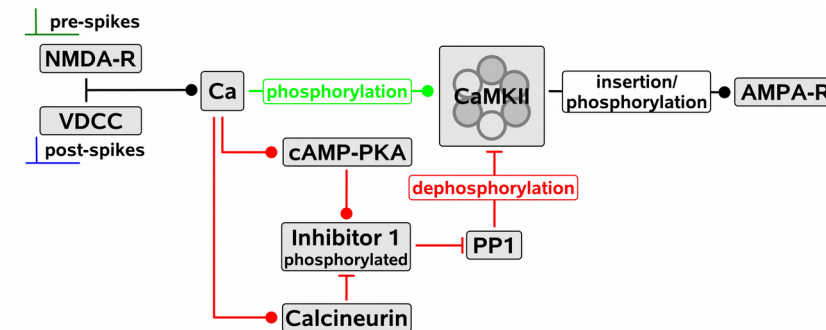

- two distinct but converging dynamical variables [Karmarkar *et al.*, 2002; Badoual *et al.*, 2006]

- phenomenological read-out of $[Ca^{2+}]$ [Rubin *et al.*, 2005]

- protein signaling cascade activated by $[Ca^{2+}]$ [Graupner & Brunel, 2007; Urakubo *et al.*, 2008]

Simplified calcium model

3. Biophysical models of synaptic plasticity

Calcium induced changes : spike-pair stimulation

STDP curve in response to spike-pair stimulation

[Graupner & Brunel, 2012]

[Bi and Poo, 1998]

Diversity of STDP curves : spike-pair stimulation

Plasticity *in vivo* : Realistic firing is highly irregular

In Vivo Visual Stimulation

[Holt *et al.*, 1996]

[Kohn and Smith, 2005]

Irregular spike-pairs flatten STDP curve

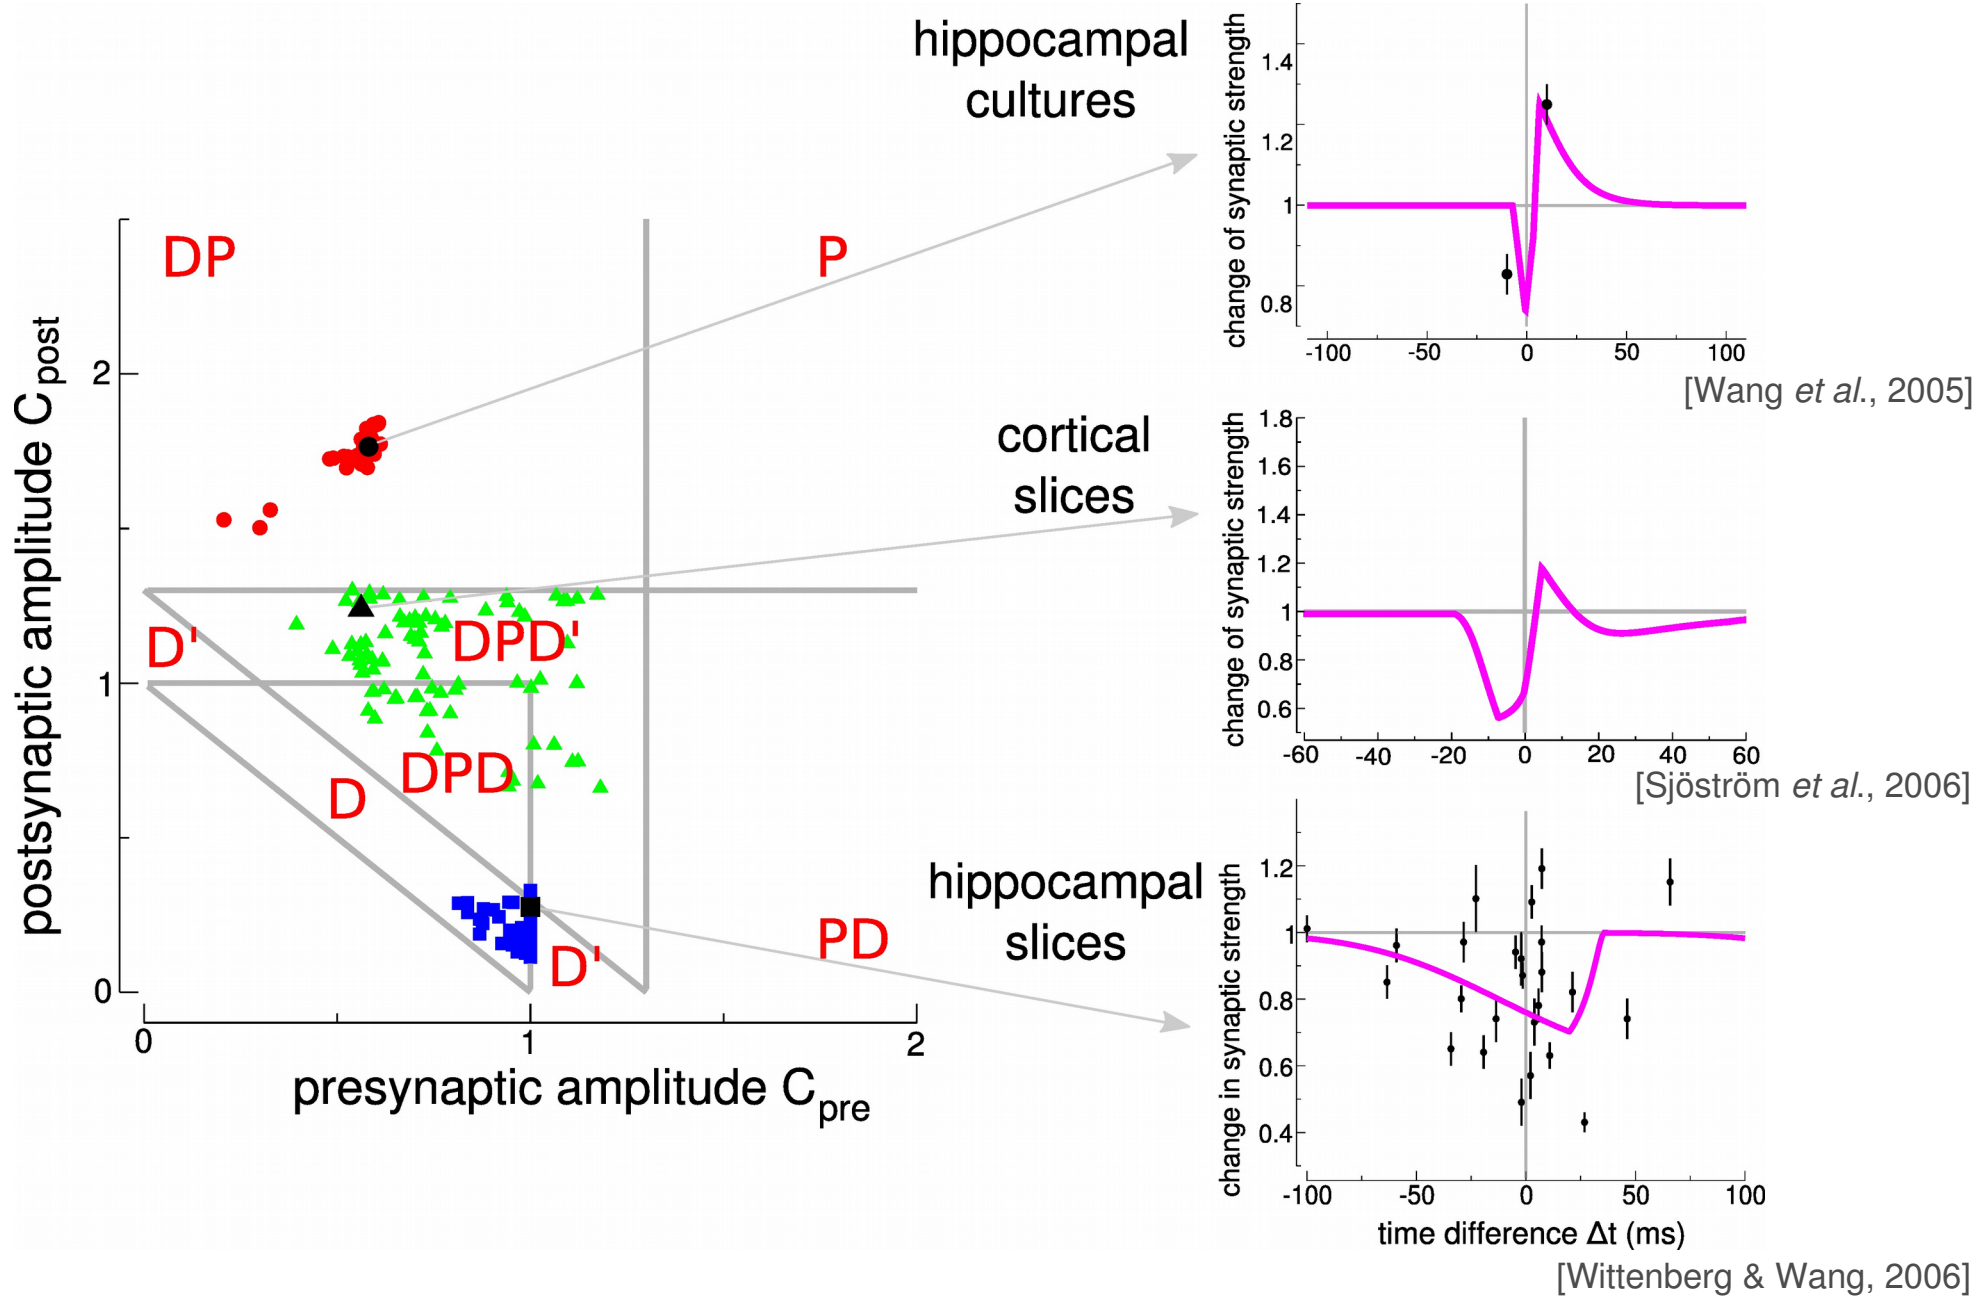

[Graupner et al. *unpublished*]

Summary

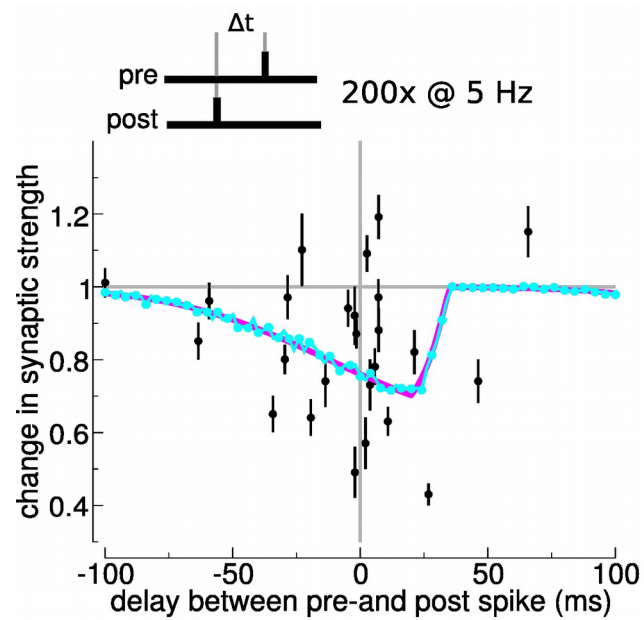

- synapses can change their transmission efficacy in an activity-dependent manner → LTP / LTD
- induction: coincident pre- and postsynaptic activity lead to calcium influx through NMDA receptors, triggering intracellular signaling cascades
- biophysical models resolve various aspects of the synaptic machinery involved in plasticity induction, *e.g.* the postsynaptic calcium dynamics
- calcium-based plasticity models can account for many aspects of the experimentally observed plasticity phenomenology.

Experiments explained by different parameter sets

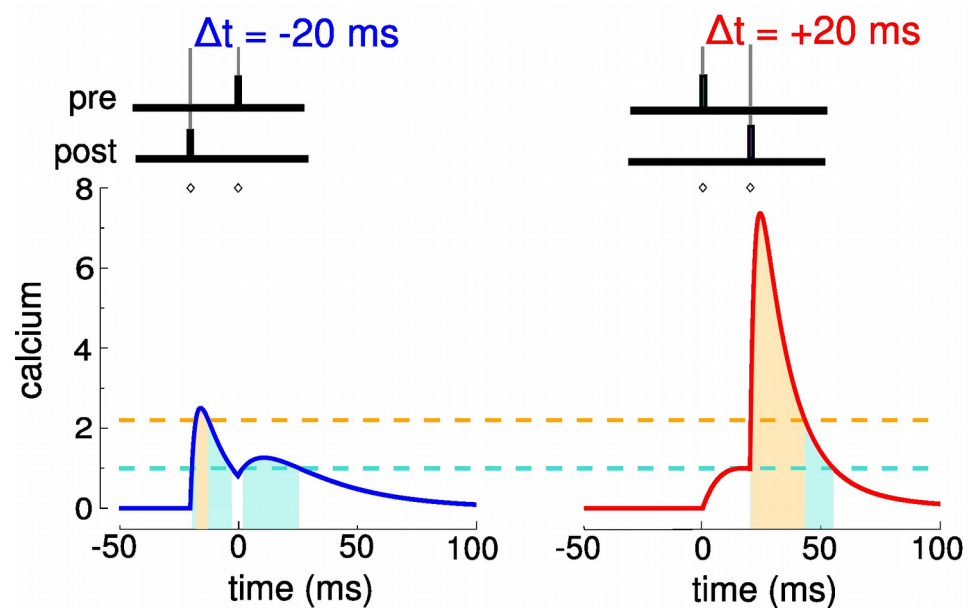

3.1 Diversity of plasticity outcomes

Malleability of hippocampal STDP explained by Ca^{2+}

[Wittenberg & Wang, 2006]

Pharmacological manipulations explained by Ca^{2+} 

[Bi & Poo, 1998; Nevian & Sakmann, 2006]

- nonlinear, finite rise time calcium transients necessary to reproduced pharmacological block experiments

long-term potentiation LTP

100 Hz for 1 s

long-term depression LTD

2x 5 Hz for 3 min,
3 min interval

Firing rate dependence in cortical slices

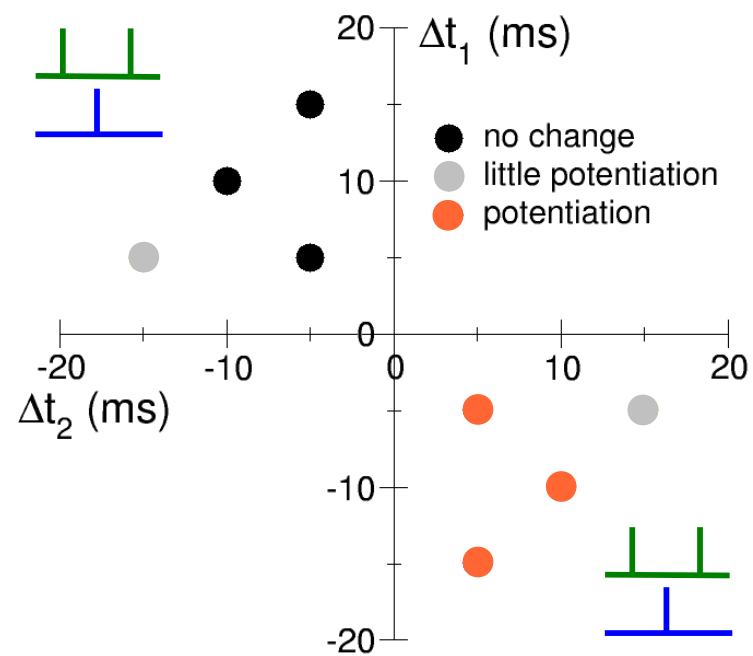

[Sjöström *et al.*, 2001]

spike-pair & frequency

[Sjöström *et al.*, 2001]

spike - triplets

[Wang *et al.*, 2005]
